Christabel Amorkor Quaye

Technical Product Owner | Software Engineer

qchristabel5@gmail.com Ghana (open to remote) LinkedIn GitHub

SUMMARY

Technical Product Owner and software engineer with five years at AmaliTech, moving from frontend delivery to owning internal data products and client discovery work. I take a problem from discovery and requirements through backlog, delivery and stakeholder validation, and I can build the frontend and API work myself. Strongest in React, Next.js, Vue and Nuxt, with hands-on Node.js, PostgreSQL and headless CMS experience, and now working full-stack in PHP and Laravel.

EXPERIENCE

PGES Accra, Ghana (remote) · Oct 2026 – Present

Junior Full-Stack Engineer, contract

- Full-stack development in PHP and Laravel across several applications.
- Working on platforms that let companies and individuals manage their pensions, savings and investments, including a USSD flow connected to a mobile network.

AmaliTech Takoradi, Ghana · Aug 2021 – Present

Technical Product Owner & Frontend Engineer

Product ownership • Internal analytics products • Frontend engineering

Grade: Associate (Oct 2024 – Present). Earlier: Internship Trainee (Aug 2021 – Nov 2022) · National Service Personnel (Nov 2022 – Oct 2023) · Junior Associate (Nov 2023 – Sep 2024)

Product: internal analytics products

- Own the Staffing Analytics Dashboard. The project started without a BRD, so I defined the problem, the stakeholders and 8 KPIs, then ran the backlog, sprint planning and stakeholder validation with the development team.
- Aligned the roadmap with a related internal product: Phase 1 reads from Jira, and a later phase moves to that product once it handles staffing requests. Coordinated the API requirements with that team and managed the change from request-level to role-level tracking. Set up the project's Confluence space (technical documentation, user guide, governance).
- Own the Global Operations Cost Dashboard. Worked with Finance in Ghana and Rwanda to map QuickBooks reporting and agree definitions. When requirements firmed up, moved the first-phase data source from a direct QuickBooks integration to structured Excel data, and kept the team aligned.
- When the scope grew into company-wide financial reporting, separated the original requirement from the wider vision so the first phase could be delivered on its own.

Client: Academy Sports + Outdoors (business analyst and developer)

- Ran technical discovery on the client's website and technology, and took part in client sessions to shape the proposals.
- Built an AI content-generation proof of concept for their editors, experimenting with different AI models, and iterated it on internal testing and client feedback.
- Wrote the business and system requirements documentation for the solution and submitted it to the client.

Engineering

- Led frontend delivery of the AmaliTech corporate website rebuild from WordPress to Next.js and Sanity CMS.
- Refactored the interactive navigation to remove duplicated code and simplify its CMS configuration for editors, and added tests around it.

- Built a working prototype of the page-break interaction to show it matched the Figma design, handed the approach to a colleague for implementation, and later fixed bugs found in testing.
- Added lazy loading with skeleton layouts, JSON-LD structured data for search engines, and fixed code-quality issues flagged in SonarQube.
- Designed reusable UI architecture using Atomic Design, built shared component libraries, integrated REST and GraphQL APIs, and built dashboards with Chart.js and Apache ECharts.
- Ran a research spike on LLM tool calling: built benchmark repos comparing end-to-end pipelines across LLM providers (Gemini, OpenAI, Claude), covering live search, scraping, content generation and automated quality scoring.

Studio Freight (via Scale Army) Remote · Nov 2025 – Apr 2026

Frontend / CMS Developer, contract

- Developed the CMS abstraction layer so Next.js and Nuxt apps read one content shape from Sanity or Storyblok.
- Enhanced and updated the existing Next.js and Nuxt starter kits.
- Built out the CMS implementation on a client project and fixed issues in both the CMS and the frontend.
- Contributed to developer tooling, debugging utilities, deployment workflows and Vercel configuration.

SELECTED PROJECTS

VoltGH: API for an EV charging platform independent project · TypeScript, Node.js, Fastify, PostgreSQL, Prisma

- Designed and built a 27-endpoint REST API over a 9-table PostgreSQL schema with versioned Prisma migrations.
- Modelled the multi-role crowdsourcing workflow as an explicit state machine, from field report through peer confirmation and admin approval to live station status.
- Implemented authentication with Argon2 password hashing, short-lived JWTs with role claims, rotating refresh tokens stored as hashes, and revocation on logout. Added role-based route guards across three roles, and account flows for registration, sign-in and password reset.
- Kept multi-write operations atomic with Prisma transactions, and mapped database constraint violations to appropriate HTTP responses.
- Built location-based radius search: a bounding-box filter first, then distance calculation to return nearby stations.

Beacon: intercity parcel delivery platform in development, not live

- Product thinking and system design for delivery between Accra, Kumasi and Takoradi: booking, collection, assignment, delivery and refunds.
- Defined the operational rules (cancellation and refunds, driver unavailability, delivery cutoffs) and kept Phase 1 separate from later ideas such as a marketplace and loyalty.

Dolphins Swim Center, Takoradi: digital transformation in progress, not live

- Product Owner and frontend engineer. Mapping how the organisation runs today, largely on paper, writing requirements and planning how those workflows move into software, while building the frontend in Next.js with a CMS.

SKILLS

Product	Discovery, BRD and system requirements, backlog and sprint planning, stakeholder management, prioritisation, KPI definition, scope management
Product tools	Jira, Confluence, Figma, Power BI
Languages	TypeScript, JavaScript, HTML5, CSS3, SCSS
Frontend	React, Next.js, Vue.js, Nuxt.js, Tailwind CSS, Styled Components
Backend	Node.js, Fastify, PHP, Laravel, REST API design, JWT and RBAC, Zod
Data	PostgreSQL, Prisma, database migrations
AI and automation	LLM tool calling, prompt and pipeline evaluation, Gemini, OpenAI and Claude APIs

State and forms	Redux, Zustand, Context API, Pinia, React Hook Form
Testing	Vitest, Jest, React Testing Library, integration testing
Headless CMS	Sanity, Storyblok, GROQ
UI libraries	shadcn/ui, Material UI, Ant Design
Charts and motion	Apache ECharts, Chart.js, Framer Motion, GSAP, Lottie
Developer tools	Git, GitHub, GitHub Actions, Vercel, Docker, Postman, SonarQube

EDUCATION AND CERTIFICATIONS

- BTech, Software Engineering, Takoradi Technical University
- HND, Information Technology, Takoradi Technical University
- AWS Certified Cloud Practitioner, 2024
- Cybersecurity Awareness, SoSafe, 2024
- Google Product Management course, Coursera (in progress)

Languages: English, Twi, Ga, basic Ewe
